

Group Project Plan

Module Code: COMP50074

Module Name: Professional Practice and Project Management

Student Names and CB Numbers

#	Student Name	CB Number	Role
1	[Student Name]	[CB Number]	Business Analyst
2	[Student Name]	[CB Number]	Scrum Master
3	[Student Name]	[CB Number]	Developer
4	[Student Name]	[CB Number]	QA Engineer

1. What Is Proposed?

Problem Statement

The organisation currently manages customer relationships, leads and sales opportunities using a combination of email, WhatsApp, Slack, phone calls, spreadsheets and personal memory. There is no single, shared record of who a lead is, what has been promised to them, what stage a deal is at, or who is responsible for following up. When a staff member is unavailable, on leave, or leaves the organisation, critical information about a client relationship is often lost entirely, damaging the client's confidence and risking the loss of the deal.

Similarly, leadership has no consolidated visibility into the sales pipeline — how many leads exist, how many have converted into paying customers, how many were lost, and why. This makes it difficult to plan resourcing, forecast revenue, or improve the sales process.

This project proposes the design and development of a centralised Customer Relationship Management (CRM) system to address these problems directly, based on requirements gathered during a structured client requirements meeting.

Project Objective and Deliverable

Project Objective	Deliverable
To design and develop a centralized Customer Relationship Management (CRM) system that allows the organisation to track leads, contacts, companies and deals in one place, replacing the current fragmented process of managing customer information across emails, chat applications, phone calls and personal memory.	• A working CRM web application covering lead, contact, company and deal management • Role-based access control restricted by assigned team • Engagement logging and manual lead status tracking • Sprint 1 and Sprint 2 documentation, test evidence, and reflective reports

2. Who Are the End Users? How Does Your Solution Address Their Needs?

End User	How Your Solution Addresses Their Needs
Sales Representative / Account Executive	Currently tracks leads and conversations across calls, WhatsApp and personal memory. The CRM gives them one place to log every interaction, move a deal through defined stages, and see the full history of a client relationship even if a colleague goes on leave.
Sales Manager	Currently has no live view of the team's pipeline. The CRM allows the manager to see all deals owned by their team, monitor progress against stages, and identify deals at risk of going cold.
Marketing	Currently generates leads that get lost in handovers between teams. The CRM lets marketing log a new lead directly into the system with full context, ensuring it is not lost when passed to sales.
Leadership / Management	Currently has no visibility into how many leads are being converted, lost, or are in progress. The CRM provides dashboards showing conversion rate, lost-lead rate, and estimated budget across a selected time period.

3. User Personas

Four personas were developed to represent the primary end users identified above. Each persona reflects real behaviours and frustrations described during the client requirements meeting, rather than assumed or invented needs.

Dinusha - Sales Representative

Account Executive, Sales Team

Goal: To close deals faster by having quick access to a client's full history and requirements.

Frustration today: Loses track of what was promised to a client when conversations happen across WhatsApp, calls, and Slack in different platforms.

Tech comfort: Comfortable with everyday apps (WhatsApp, email); needs the CRM to be simple and fast to use during or right after a call.

"If a client calls back and I don't remember what we promised them, it looks like we can't even manage a phone call."

Kasun - Sales Manager

Sales Team Lead

Goal: To see the whole team's pipeline at a glance and step in before a deal goes cold.

Frustration today: Has no visibility into individual reps' conversations or deal progress unless someone happens to mention it.

Tech comfort: Moderately tech-comfortable; wants dashboards and summaries rather than raw data.

"I need to know which deals are stuck before the client does, not after."

Amaya - Marketing Executive

Marketing Team

Goal: To hand off a qualified lead to sales with full context, so nothing is lost in the handover.

Frustration today: Leads she generates sometimes go cold because the sales team never received full context about the conversation.

Tech comfort: Comfortable with digital tools; wants a simple lead-entry form.

"I do the hard part of getting someone interested — I don't want that work to disappear the moment I hand it off."

Ruwan - Head of Leadership / Management

Senior Management

Goal: To understand, at any time, how many leads are in the pipeline, how many converted, and how many were lost — and why.

Frustration today: Currently has no consolidated reporting and must ask each team individually for updates.

Tech comfort: Not hands-on with day-to-day tools; needs high-level dashboards, not raw data entry screens.

"Whether it's recruitment, performance, or sales — my job is to be notified about what's going on in the company at all times."

Note: All problem statements, end-user needs, and persona frustrations documented above are derived directly from the client requirements meeting and are traceable to specific statements made during that session, rather than assumed.
